

Autoencoders

Dr. Mongkol Ekpanyapong

What is Autoencoder?

Autoencoder

- Auto = self
- Encode = convert into a different form

Autoencoder = a system that teaches itself how to encode information

It is a model that teaches itself how to encode information

Autoencoders

- An unsupervised learning technique that is used as a data representation
- The idea is to use CNN to act as data compression/data encoding by introducing a bottleneck layer
- We must have encoding layers and decoding layers

Loss function

$$BCE = -\frac{1}{n} \sum_{j=1}^n \sum_{i=1}^c [y_i \log(p_i) + (1 - y_i) \log(1 - p_i)]$$

- Or MSE loss

$$MSE = \frac{1}{n} \sum_{i=1}^n (Y_i - \hat{Y}_i)^2$$

Example

CNN Autoencoder

Autoencoder applications

- Denoising
- Fix Image Inpainting
- Information Retrieval
- Anomaly Detection

Autoencoders

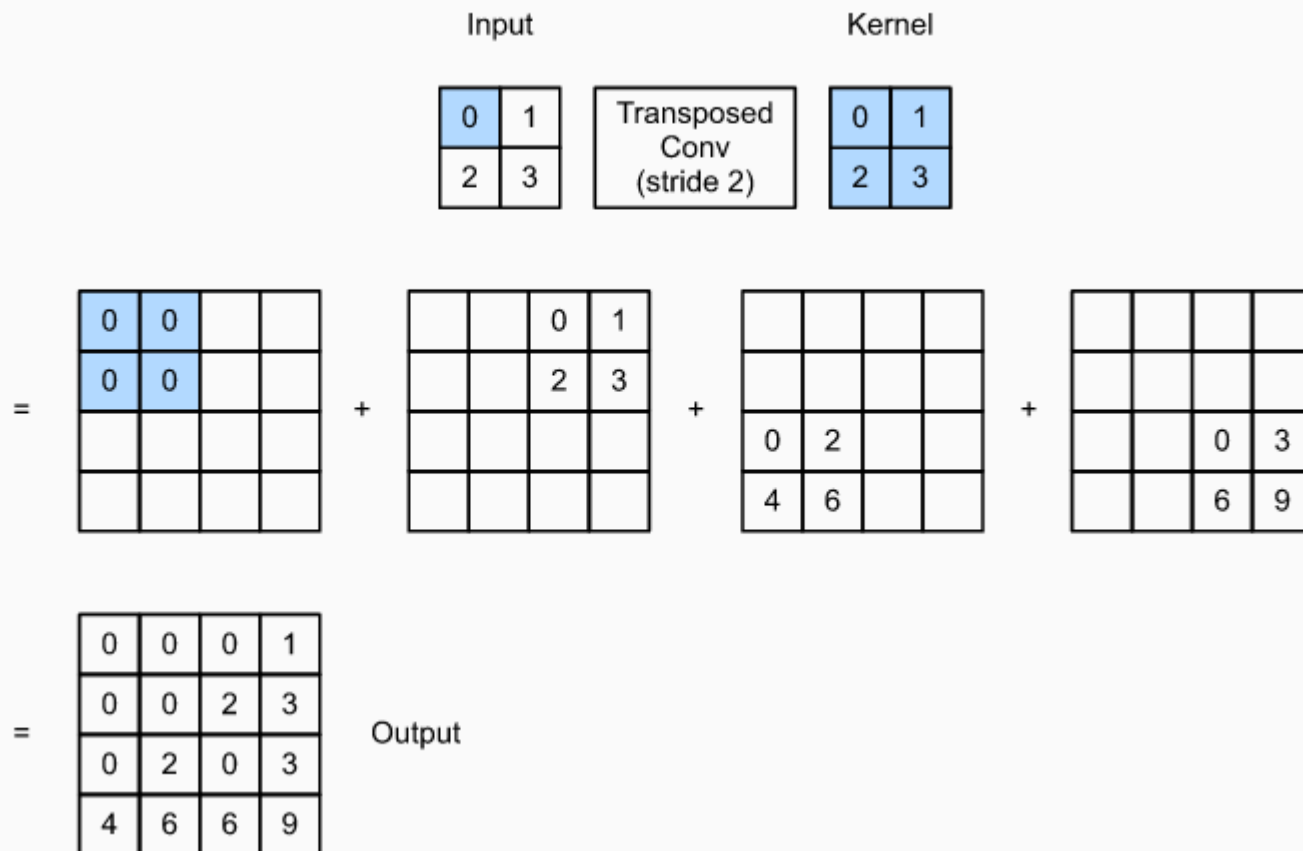

- Introduce a bottleneck layer to compress the data

Terminology

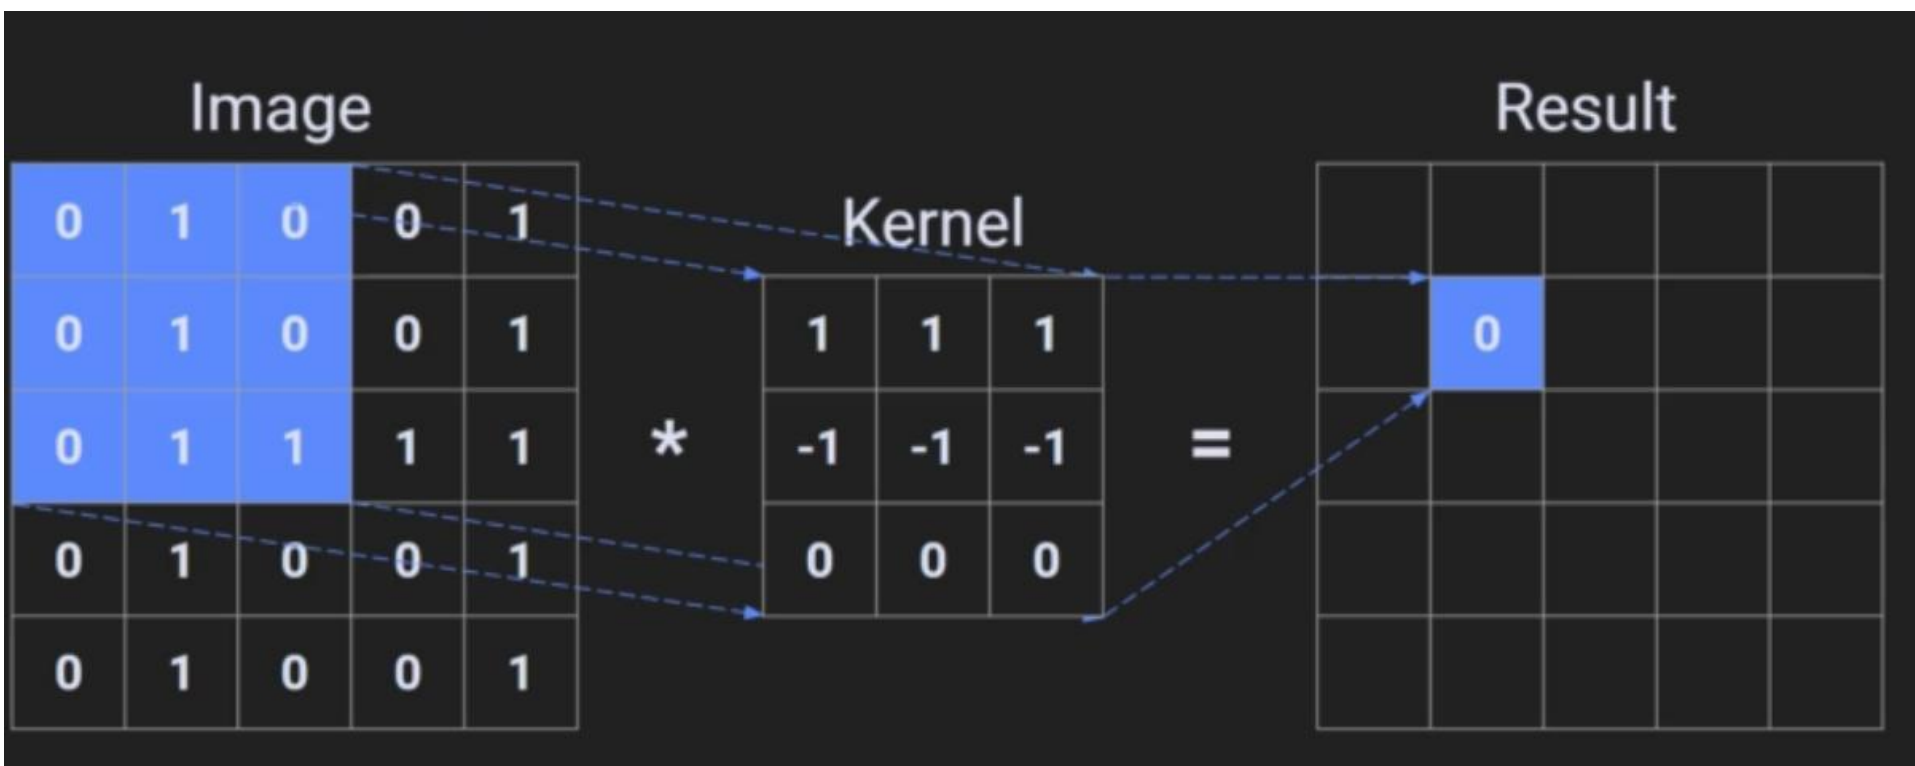

- Convolution with stride ≥ 2 (downsampling)
- Transpose convolution (upsampling)
- Note that convolution and transposed convolution is not inverse operation.
- We use it to create the correct matrix dimension and back propagation to identify the value

Convolution/Transposed Convolution

Convolution

Transpose Convolution

Result

1	1	1		
-1	-1	-1		
0	0	0		

Kernel

1	1	1
-1	-1	-1
0	0	0

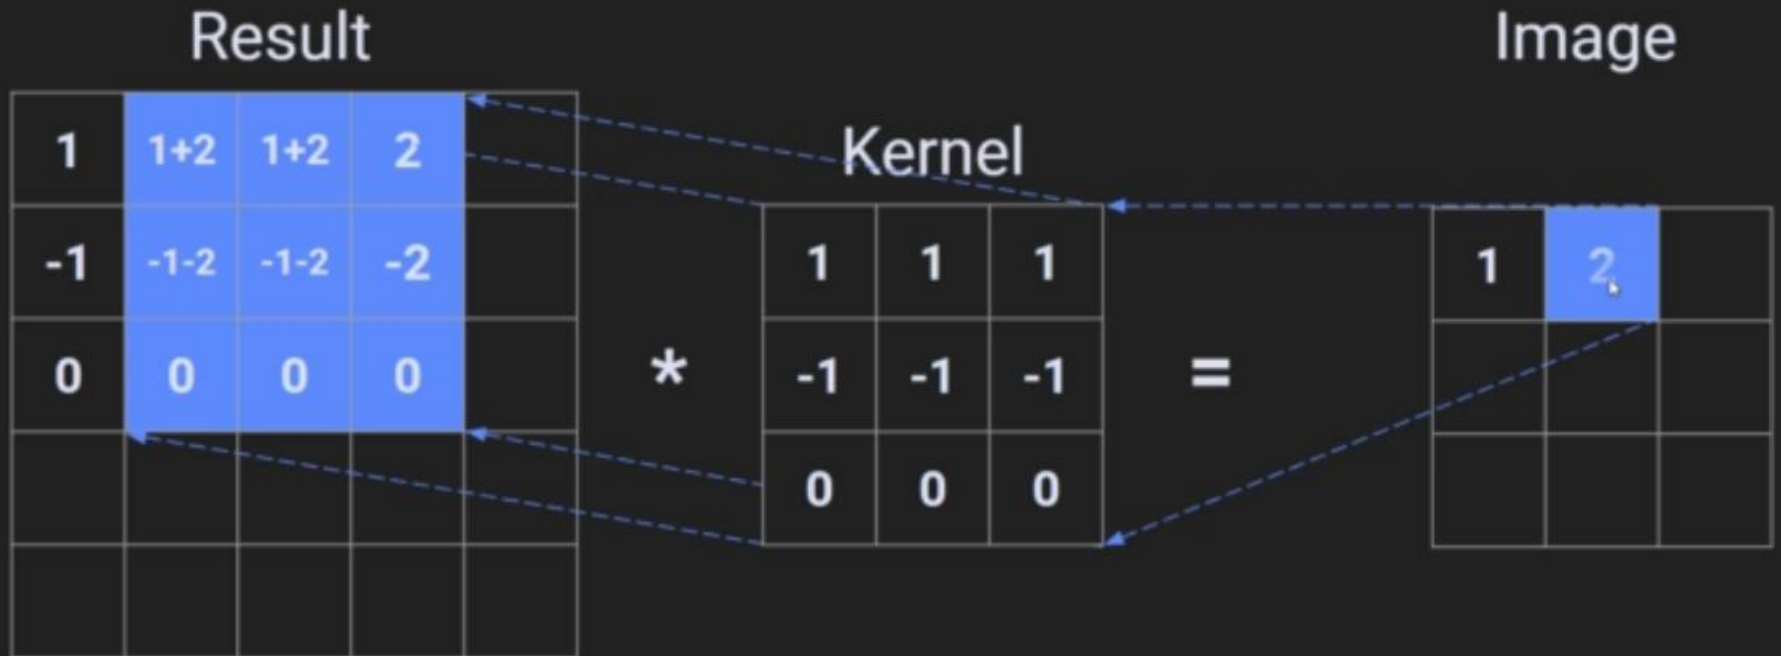

*

=

Image

1		

Next Step

Question

- Please complete the previous example when the input of the transposed convolution is:

1	2	1
0	1	0
1	-1	1

Transpose Convolution Size

$$N_h = s_h (M_h - 1) + k - 2p$$

h is for height

M is input

N is output

k is kernel

p is padding

Example

$$N_h = s_h (M_h - 1) + k - 2p$$

$$N = 1(3 - 1) + 3 - 2 \times 0$$

The number of latent variables

- The number of latent variables (the number of output neurons/dimension) of the last encoder layer/the compressing layer (the dimensionality of the compressed representation) matters. The more, the better:

Input image	2-D latent space	5-D latent space
7 2 1 0 4 1 4 9 5 9 0 6 9 0 1 5 9 7 8 4 9 6 6 5 4 0 7 4 0 1 3 1 3 4 7 2 7 1 2 1 1 7 4 2 3 5 1 2 4 4 6 3 5 5 6 0 4 1 9 5 7 8 9 3 7 4 6 4 3 0 7 0 2 7 1 7 3 2 7 7 1 6 2 7 8 4 7 3 6 1 3 6 7 3 1 4 1 7 6 9	7 2 1 0 4 1 4 9 8 9 0 6 9 0 1 5 9 7 5 9 9 6 6 5 9 0 7 4 0 1 3 1 3 6 7 2 7 1 2 1 1 7 9 2 3 5 1 2 9 4 6 3 5 5 6 0 4 1 9 5 7 8 9 3 9 9 6 4 3 0 7 0 2 7 1 7 3 2 7 7 1 6 2 7 8 4 7 3 6 1 3 6 7 3 1 4 1 7 6 9	7 2 1 0 4 1 4 9 5 9 0 6 9 0 1 5 9 7 8 4 9 6 6 5 4 0 7 4 0 1 3 1 3 4 7 2 7 1 2 1 1 7 4 2 3 5 1 2 4 4 6 3 5 5 6 0 4 1 9 5 7 8 9 3 7 4 6 4 3 0 7 0 2 7 1 7 3 2 7 7 1 6 2 7 8 4 7 3 6 1 3 6 7 3 1 4 1 7 6 9

Training an Autoencoder

- The label data is the same as training data
- The loss function can be binary cross entropy or MSE
- Autoencoder are lossy

```
autoencoder.fit(x_train, x_train,  
               epochs=50,  
               batch_size=256,  
               shuffle=True,  
               validation_data=(x_test, x_test))
```

Example

- See Jupiter Notebook

Deep Fake with AutoEncoder

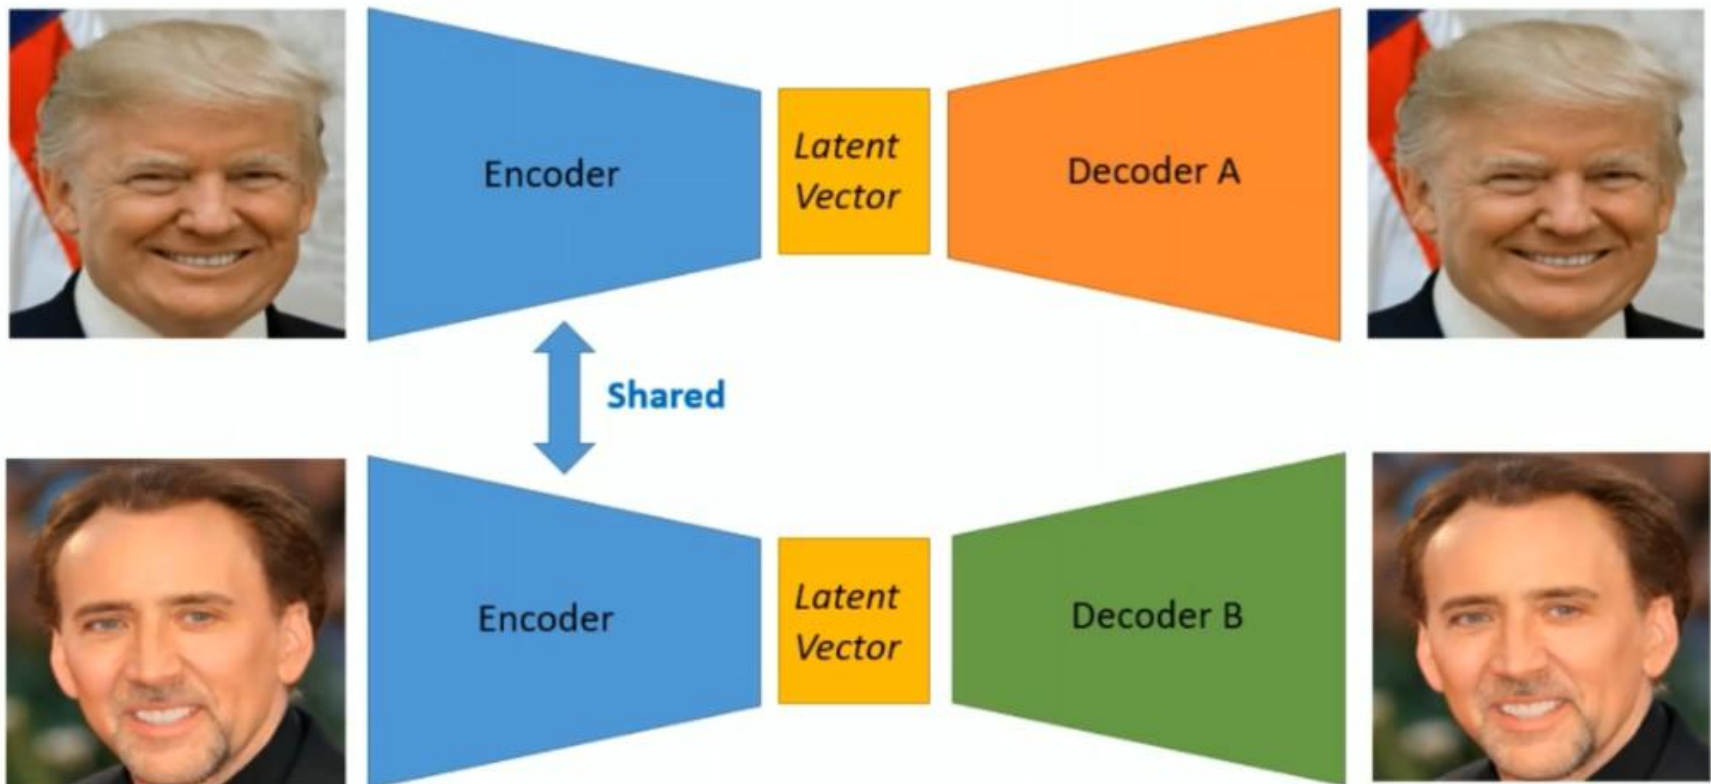

Donald Trump → Mr. Bean

Home Alone → Home Stallone

Training Phase

The **Decoder A** is only trained with faces of A; the **Decoder B** is only trained with faces of B. However, all latent faces are produced by the **same Encoder**.

Variation AutoEncoder vs. AutoEncoder

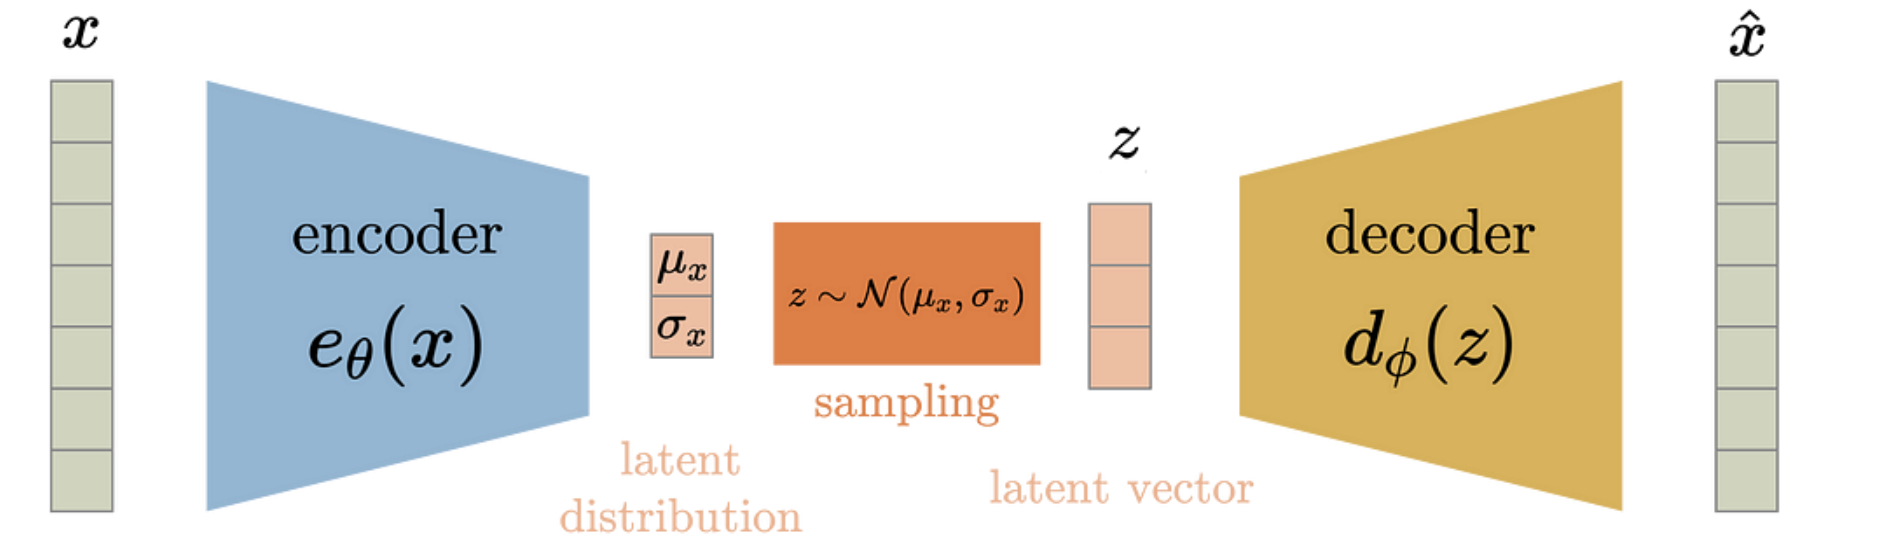

AutoEncoder

$$loss = \|x - \hat{x}\|_2 = \|x - d_{\phi}(z)\|_2 = \|x - d_{\phi}(e_{\theta}(x))\|_2$$

Variational AutoEncoder

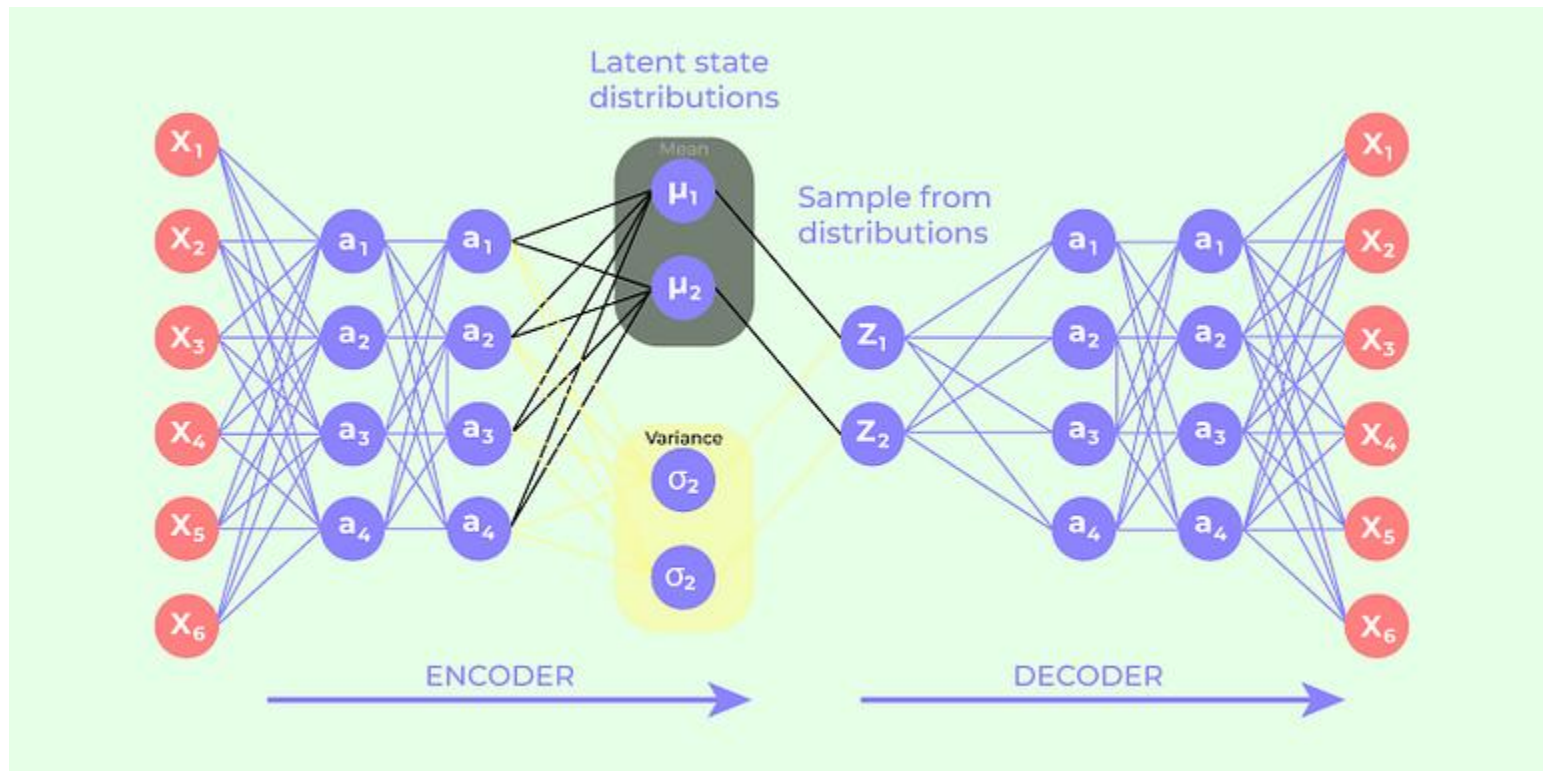

reconstruction loss $= \|x - \hat{x}\|_2 = \|x - d_{\phi}(z)\|_2 = \|x - d_{\phi}(\mu_x + \sigma_x \epsilon)\|_2$

$$\mu_x, \sigma_x = e_{\theta}(x), \quad \epsilon \sim \mathcal{N}(\mathbf{0}, \mathbf{I})$$

$$\text{similarity loss} = KL \text{ Divergence} = D_{KL}(\mathcal{N}(\mu_x, \sigma_x) \parallel \mathcal{N}(\mathbf{0}, \mathbf{I}))$$

$$\text{loss} = \text{reconstruction loss} + \text{similarity loss}$$

Latent dimension = 4

Questions?

Homework

- Denoising Occluded Mnist

Modify noisy data with this occlude function instead

```
import random
def occlude(array):
    """ Adds occlusion. """
    new_array = copy.deepcopy( array )
    print(new_array.shape)
    for k in range( len(new_array)):
        x = random.randint(0,25)
        new_array[k,x:x+2,:]= 1.0
    return new_array
```

Variational Auto Encoder
